

# Tantrums, Tears, and Tempers: Behavior is communication

What's really going on when your child throws a tantrum at a store or cries incessantly before bedtime? Most likely, your child is trying to express something that they can't say in words. It might mean they want a candy bar or toy, or it might mean they are afraid of the dark. By understanding what your child is trying to express, you can better respond to their needs and help your child learn more positive ways to communicate.

For young children, behavior is communication that's used to meet needs. It's how they let you know they either want something or want to avoid something.

Here are some questions you can consider asking about your child's challenging behaviors and some steps you can take to help decrease the likelihood of that behavior from happening again.

## **What is the purpose of the behavior?**

To determine the purpose of your child's behavior, start by looking at what is happening before and after it begins. Consider changes in routines, times of the day it happens, and social situations that seem to trigger it. If you can identify the purpose of your child's behavior, you can come up with other strategies to address their needs to encourage positive behaviors.

Try to keep your focus on what your child is communicating and avoid labeling the behavior or your child as "bad." When you do, you'll be able to better put the behavior in perspective and focus on strategies to help your child acquire needed skills.

## **What factors affect behavior?**

Your child's developmental stage, temperament, and disability-related needs all affect their behavior. Here's how.

### **1. Children have development stages**

Child development guidelines suggest the ages at which children typically develop various physical, reasoning, social, and emotional skills. Being familiar with these guidelines can help you pinpoint major areas where your child might be lagging. Developmental delays can affect your child's ability to communicate with you.

### **2. Temperament**

Temperament describes the way a child tends to react to people, places, and experiences. Children who are easygoing usually are quick to adapt to new situations and are comfortable with new experiences. Children who are intense tend to react dramatically, take longer to adapt, and can be easily frustrated. Children who are fearful are cautious, slower to adapt, and may take longer to be comfortable with new experiences. For example, if your child is intense, moving immediately from one activity to another might trigger an outburst. Careful planning on how to transition your child slowly from one activity to another will be key to fostering positive behavior.

### **3. Disability**

Your child's disability also may affect their behavior. A child with sensory disorders, for example, may not be able to handle noisy spaces with many people. A child with autism might find making eye contact and being around other children stressful. As a result, such children may communicate their feelings through tantrums.

---

## **How should a parent encourage positive behaviors?**

Knowing that behavior has a purpose and is affected by other factors, you can help your child build the necessary skills to communicate more effectively. Here are some strategies to try.

### **1. Set clear expectations**

Positively state the appropriate behaviors you want to see. Instead of telling your child “Don’t stand on the table.” You might say “Please put your feet on the ground.”

### **2. Provide structure and consistency**

Young children need consistent schedules and ground rules. This helps provide a safe and predictable environment for them to learn appropriate behaviors over time.

### **3. Collect data**

Keep a log that documents challenging behaviors. Note when the behavior occurs, what your child is doing before and after it happens, and what is going on in their environment when the behavior takes place. If you see a consistent pattern of behavior think about other ways you can help your child to get what they need.

### **4. Reinforce and name positive behavior**

Be sure to praise your child when you “Catch” them behaving as expected. By naming the appropriate behavior for your child, you are helping them reinforce it. For example, you might say, “Sharing your toys with Sally is a nice thing to do.”

### **5. Give words for emotions**

Help your child identify emotions and needs in certain situations by teaching simple phrases such as “I don’t like that!” or “Help me!” Also give your child the language to explain feelings and bring a conclusion to them. For example, you might teach them to say, “I’m all done being mad.”

### **6. Change the environment**

If you can change the environment so a behavior is reduced or eliminated, it will help your child.

### **7. Give choices**

Give your child a sense of control by offering basic choices. To keep things simple, it’s best to give only two options, such as, “Do you want to wear your blue shirt or your yellow shirt?”

### **8. Avoid power struggles**

Try to compromise with your child. Instead of telling your child what to do, especially on less preferred requests, offer support and join them. For example, you might say, “I’ll pick up one toy and you pick up one toy.”

### **9. Model behaviors**

Show your child how to handle stressful situations by staying calm. Let your child see you use positive coping strategies such as taking deep breaths.

### **10. Support your child**

Tantrums and outbursts can be frightening for your child. Remind your child you are there to work through big feelings together. Let your child know that while you may not like certain behaviors, they have your unconditional love and support as they learn positive ways to communicate, cope and manage their behavior.

## **Summary**.....

Behavior is how your child tells you something that cannot be told in words. It is affected by your child’s developmental stage, temperament, and type of disability. To understand behavior, it is helpful to be aware of what they get by using the behavior. Understanding their developmental stage, disability, strengths and needs will help you develop more effective strategies and encourage positive coping skills and appropriate behavior.
